Alcohol Use in the United States

» Prevalence of Drinking: According to the 2019 National Survey on Drug Use and Health (NSDUH), 85.6 percent of people ages 18 and older reported that they drank alcohol at some point in their lifetime, 1 69.5 percent reported that they drank in the past year, 2 and 54.9 percent (59.1 percent of men in this age group and 51.0 percent of women in this age group) reported that they drank in the past month. 3

» Prevalence of Binge Drinking and Heavy Alcohol Use: In 2019, 25.8 percent of people ages 18 and older (29.7 percent of men in this age group and 22.2 percent of women in this age group) reported that they engaged in binge drinking in the past month, 4 and 6.3 percent (8.3 percent of men in this age group and 4.5 percent of women in this age group) reported that they engaged in heavy alcohol use in the past month. 5 (See glossary for definitions of binge drinking and heavy alcohol use.)

» Emerging Trend—High-Intensity Drinking: High-intensity drinking is defined as consuming alcohol at levels that are two or more times the gender-specific binge drinking thresholds (See glossary for additional details about the definition of high-intensity drinking). Compared with people who did not binge drink, people who drank alcohol at twice the gender-specific binge drinking thresholds were 70 times more likely to have an alcohol-related emergency department (ED) visit, and those who consumed alcohol at 3 times the gender-specific binge thresholds were 93 times more likely to have an alcohol-related ED visit. 6

Alcohol Use Disorder (AUD) in the United States

» People Ages 12 and Older: According to the 2019 NSDUH, 14.5 million (nearly 15 million) people ages 12 and older (5.3 percent of this age group) had AUD. This number includes 9.0 million men (6.8 percent of men in this age group) and 5.5 million women (3.9 percent of women in this age group).

» Youth Ages 12 to 17: According to the 2019 NSDUH, an estimated 414,000 adolescents ages 12 to 17 (1.7 percent of this age group) had AUD. This number includes 163,000 males (1.3 percent of males in this age group) and 251,000 females (2.1 percent of females in this age group).

Treatment of AUD in the United States

» According to the 2019 NSDUH, about 7.2 percent of people ages 12 and older who had AUD in the past year received any treatment in the past year. This includes about 6.9 percent of males
and 7.8 percent of females with past-year AUD in this age group. According to the 2019 NSDUH, about 6.4 percent of adolescents ages 12 to 17 who had AUD in the past year received any treatment in the past year. This includes about 6.4 percent of males and 6.4 percent of females with past-year AUD in this age group.  

» According to the 2019 NSDUH, about 7.3 percent of adults ages 18 and older who had AUD in the past year received any treatment in the past year. This includes about 6.9 percent of males and 7.9 percent of females with past-year AUD in this age group.  

» Less than 4 percent of people with AUD were prescribed a medication approved by the U.S. Food and Drug Administration (FDA) to treat their disorder.  

» People with AUD were more likely to seek care from a primary care physician for an alcohol-related medical problem, rather than specifically for drinking too much alcohol.

Alcohol-Related Emergencies and Deaths in the United States

» The rate of all alcohol-related ED visits increased 47 percent between 2006 and 2014, which translates to an average annual increase of 210,000 alcohol-related ED visits.

» Alcohol contributes to about 18.5 percent of ED visits and 22.1 percent of overdose deaths related to prescription opioids.

» An estimated 95,000 people (approximately 68,000 men and 27,000 women) die from alcohol-related causes annually, making alcohol the third-leading preventable cause of death in the United States. The first is tobacco, and the second is poor diet and physical inactivity.

» Between 2011 and 2015, the leading causes of alcohol-attributable deaths due to chronic conditions in the United States were alcohol-associated liver disease, heart disease and stroke, unspecified liver cirrhosis, upper aerodigestive tract cancers, liver cancer, supraventricular cardiac dysrhythmia, AUD, breast cancer, and hypertension.

» In 2015, alcohol-impaired driving fatalities accounted for 10,265 deaths (29.0 percent of overall driving fatalities).
Economic Burden in the United States

» In 2010, alcohol misuse cost the United States $249.0 billion.\textsuperscript{18}

» Three-quarters of the total cost of alcohol misuse is related to binge drinking.\textsuperscript{18}

Global Burden

» In 2016, 3 million deaths, or 5.3 percent of all global deaths (7.7 percent for men and 2.6 percent for women), were attributable to alcohol consumption.\textsuperscript{19}

» Globally, alcohol misuse was the seventh-leading risk factor for premature death and disability in 2016.\textsuperscript{20}

» According to a 2014 World Health Organization (WHO) report, among people ages 15 to 49, alcohol misuse was the first-leading risk factor for premature death and disability.\textsuperscript{20}

» In 2016, approximately 14 percent of total deaths among people ages 20 to 39 are alcohol attributable.\textsuperscript{21}

» In 2016, 5.3 percent of the burden of disease and injury worldwide (134 million disability-adjusted life-years [DALYs]) was attributable to alcohol consumption.\textsuperscript{19}

» In 2018, WHO reported that alcohol contributed to more than 200 diseases and injury-related health conditions, ranging from liver diseases, road injuries, and violence, to cancers, cardiovascular diseases, suicides, tuberculosis, and HIV/AIDS.\textsuperscript{22}

» In 2016, of all deaths attributable to alcohol consumption worldwide, 28.7 percent were due to injuries, 21.3 percent were due to digestive diseases (primarily cirrhosis of the liver and pancreatitis), 19 percent were due to cardiovascular diseases, 12.9 percent were due to infectious diseases (including tuberculosis, pneumonia, and HIV/AIDS), and 12.6 percent were due to cancers (most prominently those of the upper aerodigestive tract).\textsuperscript{21}

Consequences for Families in the United States

» Approximately 10.5 percent (7.5 million) of U.S. children ages 17 and younger live with a parent with AUD, according to a 2017 report.\textsuperscript{23}

Underage Drinking in the United States

» Prevalence of Underage Alcohol Use
  • Prevalence of Drinking: According to the 2019 NSDUH, 39.7 percent of 12- to 20-year-olds reported that they have had at least 1 drink in their lives.\textsuperscript{25} About 7.0 million people ages 12 to 20\textsuperscript{24} (18.5 percent of this age group\textsuperscript{25}) reported drinking alcohol in the past month (17.2 percent of males and 19.9 percent of females\textsuperscript{25}).

Glossary (continued)

Disability-adjusted life-years: A measure of years of life lost or lived in less than full health.

Heavy alcohol use (or heavy drinking): SAMHSA defines heavy alcohol use as binge drinking on 5 or more days in the past month.

High-intensity drinking: Consumption of 2 or more times the gender-specific thresholds for binge drinking, which is to say 10 or more standard drinks (or alcoholic drink-equivalents) for males and 8 or more for females. High-intensity drinking is consistent with drinking at binge levels II and III. The levels correspond to one to two times (I), two to three times (II), and three or more times (III) the standard gender-specific binge thresholds.\textsuperscript{6}

Patterns of drinking associated with AUD: Binge drinking and heavy alcohol use can increase an individual’s risk of AUD. The U.S. Dietary Guidelines recommend that if alcohol is consumed, it should be in moderation, defined as up to 1 drink per day for women and up to 2 drinks per day for men, and only by adults of legal drinking age. Some individuals should avoid alcohol completely.

Underage drinking: Alcohol use by anyone under the age of 21. In the United States, the legal drinking age is 21.
• **Prevalence of Binge Drinking:** According to the 2019 NSDUH, approximately 4.2 million people ages 12 to 20\(^{24}\) reported binge drinking in the past month. This represents 11.1 percent of people in this age group (10.4 percent of males ages 12 to 20 and 11.8 percent of females ages 12 to 20\(^{25}\)).

• **Prevalence of Heavy Alcohol Use:** According to the 2019 NSDUH, approximately 825,000 people ages 12 to 20\(^{24}\) reported heavy alcohol use in the past month. This represents 2.2 percent of this age group\(^{26}\) (2.1 percent of males ages 12 to 20 and 2.3 percent of females ages 12 to 20\(^{25}\)).

**Trend in Underage Alcohol Use**

- NSDUH findings have demonstrated a decline in underage drinking. From 2002 to 2019, the prevalence of past-30-day alcohol use decreased 41.1 percent for 16- to 17-year-olds, 54.7 percent for 14- to 15-year-olds, and 61.9 percent for 12- to 13-year-olds.\(^{26}\)

**Consequences of Underage Alcohol Use**

- Research indicates that alcohol use during the teenage years can interfere with normal adolescent brain development and increase the risk of developing AUD. In addition, underage drinking contributes to a range of acute consequences, such as injuries, sexual assaults, alcohol overdoses, and deaths—including those from motor vehicle crashes.\(^{27}\)
- Alcohol is a factor in the deaths of thousands of people younger than age 21 in the United States each year. This includes:
  - 1,072 from motor vehicle crashes\(^{28}\)
  - 1,000 from homicides\(^{29}\)
  - 208 from alcohol overdose, falls, burns, and drowning\(^{29}\)
  - 596 from suicides\(^{29}\)

**Alcohol and U.S. College Students**

**Prevalence of Alcohol Use**

- **Prevalence of Drinking:** According to the 2019 NSDUH, 52.5 percent of full-time college students ages 18 to 22 drank alcohol in the past month, compared with 44.0 percent of other persons of the same age.\(^{30}\)
- **Prevalence of Binge Drinking:** According to the 2019 NSDUH, 33.0 percent of full-time college students ages 18 to 22 reported binge drinking in the past month, compared with 27.7 percent of other persons of the same age.\(^{30}\)
- **Prevalence of Heavy Alcohol Use:** According to the 2019 NSDUH, 8.2 percent of full-time college students ages 18 to 22 reported heavy alcohol use in the past month, compared with 6.4 percent of other persons of the same age.\(^{30}\)

**Consequences of Alcohol Use**

- The most recent NIAAA statistics estimate that each year, 1,519 college students ages 18 to 24 die from alcohol-related unintentional injuries, including motor vehicle crashes.\(^{31}\)
- The most recent NIAAA statistics estimate that each year, 696,000 students ages 18 to 24 are assaulted by another student who has been drinking.\(^{32}\)
- The most recent NIAAA statistics estimate that each year, 97,000 students ages 18 to 24 report experiencing alcohol-related sexual assault or date rape.\(^{32}\)
- According to the 2019 NSDUH, 8.7 percent of full-time college students ages 18 to 22 meet the criteria for AUD.\(^{33}\)

**Alcohol and Pregnancy in the United States**

- According to the 2019 NSDUH, 9.5 percent of pregnant women ages 15 to 44 in the United States used alcohol in the past month.\(^{34}\)
The prevalence of fetal alcohol syndrome in the United States was estimated by the Institute of Medicine in 1996 to be between 0.5 and 3.0 cases per 1,000.\(^{35}\)

An NIAAA-supported study of more than 6,000 first graders across four U.S. communities estimated that as many as 1–5 percent of first-grade children have fetal alcohol spectrum disorders (FASD).\(^{36}\)

Alcohol and the Human Body

In 2019, of the 85,688 liver disease deaths among individuals ages 12 and older, 43.1 percent involved alcohol. Among males, 53,486 liver disease deaths occurred, and 45.6 percent involved alcohol. Among females, 32,202 liver disease deaths occurred, and 39.0 percent involved alcohol.\(^{37}\)

Among all cirrhosis deaths in 2015, 49.5 percent were alcohol related. The proportion of alcohol-related cirrhosis deaths was highest (76.8 percent) among persons ages 25 to 34, followed by persons ages 35 to 44, at 72.7 percent.\(^{38}\)

From 2010 to 2016, alcohol-related liver disease was the primary cause of almost 1 in 3 liver transplants in the United States, replacing hepatitis C virus infection as the leading cause of liver transplantation due to chronic liver disease.\(^{39,40}\)

Research has shown that people who drink excessively have a greater risk of liver disease, heart disease, depression, stroke, and stomach bleeding, as well as cancers of the oral cavity, esophagus, larynx, pharynx, liver, colon, and rectum.\(^{41,42}\) These individuals may also have problems managing conditions such as diabetes, high blood pressure, pain, and sleep disorders. They may increase their likelihood of unsafe sexual behavior.

Moderate drinking, defined as up to 1 drink per day for women and 2 drinks per day for men, is associated with increased risk of drowning\(^{43}\) and injuries from violence,\(^{46,47}\) falls,\(^{47}\) and motor vehicle crashes.\(^{47,48}\) Moderate drinking is also associated with an increased risk of female breast cancer,\(^{44,49}\) oropharyngeal cancer,\(^{44,49}\) esophageal cancer (especially in individuals who inherit a deficiency in an enzyme involved in alcohol metabolism),\(^{39,44,50}\) and harmful medication interactions.\(^{51,52,53,56}\) Moderate drinking has been linked to risk for FASD in the offspring of women who consume alcohol during pregnancy.\(^{55}\)
